SUMMARY

Backend and data engineer building high-throughput systems at Contentstack: a Go platform processing billions of log events and analytics APIs serving 2B+ monthly calls. Also builds Python RAG systems with vector search, re-ranking, and self-correcting retrieval, and works with AI-assisted tools (Cursor, Claude Skills, MCP).

SKILLS

Languages	Python, Go, TypeScript, JavaScript, SQL
GenAI & LLMs	LangChain, LangGraph, LlamaIndex, RAG (Advanced/Corrective/Self-RAG), Agents, Tool-calling, Prompt Engineering, Guardrails, OpenAI/Anthropic/HF APIs, vLLM, Ollama, TGI
AI Platform & Gateway	Model routing, Rate limiting, Prompt/Model/Agent/MCP registries, Observability, Guardrails, Usage tracking
Backend & Design	FastAPI, NestJS, Node.js, Express, gRPC & Protobuf, REST/OpenAPI, Factory Pattern, System/API Design
Data	MongoDB, Elasticsearch, ChromaDB/Pinecone, Apache Spark, AWS Athena (SQL), Kafka, Redis
Platform	Docker, Kubernetes, AWS/GCP/Azure, Snyk, Trivy, Git

EXPERIENCE

Software Engineer Aug 2024 - Present
Contentstack *Bengaluru, India (On-site)*

- **Audit Logging Platform (Go):** Architected and built a multithreaded, low-resource Go system (Logs Service + Logs Consumer) processing billions of audit, webhook, and publish logs. Designed and shipped multi-Kafka-topic support in the SDK, resolved issues in the legacy Mongo-to-Elasticsearch query translation layer, and implemented a direct Elasticsearch query path for complex queries. Onboarded 6 products and resolved production RCAs as the primary point of contact.
- **Content Operations Analytics (MongoDB/Elasticsearch):** Designed a full-scan analytics system across multi-cluster MongoDB and Elasticsearch collections where the legacy core product lacked reliable timestamps for incremental change detection. Accurately counted 67 distinct operation types at scale across 100K+ entries and millions of daily publishes per organization. Powers Content Life Cycle, Workflow Health, and Team Adoption surfaces.
- **Analytics API (API Design):** Built customer-facing Analytics APIs powering dashboards that aggregate 2B+ monthly API calls across internal and external surfaces. Reconciled output inconsistencies from legacy foundations while preserving existing API conventions and improving error handling. Own the API's ongoing evolution and reliability.
- **Feature Adoption (Service Design):** Architected and built a Factory-pattern NestJS service end-to-end, unifying audit trails, metered events, MongoDB, and analytics into a single customer usage view. Shipped as both an npm package and a micro-frontend for cross-team reuse.
- **Athena Export (SQL):** Built paginated SQL-backed export supporting retrieval of 10,000+ records, with a precheck catching row-limit failures before a job runs.
- **Webhooks (API Design):** Extended a trigger → executor → retry pipeline with 75+ new scope-and-action combinations as new CMS features launched, without breaking existing flows.
- **AI-first Engineering:** Integrated Cursor (custom rules, hooks, Agent Mode) and Claude Skills/MCP into daily development to accelerate implementation, refactoring, and test coverage generation.

- **Platform Reliability:** Led a security hardening sweep across 10 services, upgrading Node.js to v24 and Go to v1.24, adopting non-root Alpine multi-stage images, remediating zlib/OpenSSL CVEs, and integrating Snyk/Trivy into the development loop.

Software Engineer Intern Jan 2024 - Jul 2024
Contentstack *Bengaluru, India (On-site)*

- Built the Customer Plan Management Tool's internal CRM audit-log module from scratch, including filtering, pagination, and date-range selection, establishing patterns reused across later admin surfaces.
- Delivered mail templates/logs and rollout feature UI.
- Built a tech-event website using Contentstack as the CMS.

PROJECTS

Production-Grade RAG Pipeline (LangChain & Python)

- Built a RAG pipeline in LangChain and Python to ingest, chunk, and embed unstructured data as LLM prompt context.
- Integrated a vector database (ChromaDB/Pinecone) for semantic search, improving answer relevance and reducing hallucinations.
- Added production patterns: environment-based config, clean data pipelines, and token-usage optimization.

Custom RAG Framework & Retrieval Experiments (Python)

- Built a low-level RAG framework in Python to test text chunking, embedding generation, and vector search strategies.
- Implemented multi-query translation, RAG-Fusion, and cross-encoder re-ranking to improve context relevance.
- Added guardrails and Self-RAG loops to reduce hallucinations and correct low-confidence outputs.

EDUCATION

Bachelor of Engineering - Computer Science 2020 - 2024
JSS Science and Technology University (SJCE), Mysuru CGPA: 9.05

CERTIFICATIONS

- Claude 101, Anthropic Oct 2026
- Databricks Fundamentals Accreditation, Databricks Mar 2025 - Mar 2026
- Machine Learning Specialization, DeepLearning.AI & Stanford
- Google Data Analytics Professional Certificate
- Google UX Design Professional Certificate
